**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

**Office Action Summary**

Application No.

09/630,798

Applicant(s)

HATANAKA, KOJI

Examiner

Gregory G. Todd

Art Unit

2157

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 02 May 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 30-68 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 30-68 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Response to Amendment***

1. This office action is in response to applicant's amendment filed 02 May 2007, of application filed, with the above serial number, on 02 August 2000 in which claims 30, 36, 37, 43, 44, 50, 51, 57, and 63 have been amended. Claims 30-68 are therefore pending in the application.

### ***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 30-68 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pavley (hereinafter "Pavley", 6,445,460) in view of Niikawa (hereinafter "Niikawa", 6,668,134) and further in view of Ward et al (hereinafter "Ward", 6,784,924).

Pavley teaches the invention, substantially, as claimed including image transferring according to transfer history (see abstract).

As per Claim 30, Pavley teaches an image transferring apparatus, comprising:  
a storage unit, adapted to store image data (memory) (at least col. 2, lines 34-46);

an image data transfer instruction unit, adapted to enable a user to enter an instruction to transfer the image data (at least col. 5, lines 45-60; col. 6, lines 10-24);

a display unit, adapted to display a screen (at least Fig. 1; LCD screen; col. 6, lines 10-23); and

a transfer control unit, adapted to perform control to transfer the image data, in response to an instruction to transfer entered by the user with said image data transfer instruction unit, and to judge a selection selected from the screen displayed by said display unit (auto image transfer according to archive attribute) (at least col. 6, lines 3-24).

Pavley fails to explicitly teach offering the user control over transferring either (1) only any image not previously transferred or (2) all images stored in the storage medium, and (3) the image data transfer instruction unit being a button for instructing the image data transfer. However, the use and advantages for using such image transfer control is well known to one skilled in the art at the time the invention was made as evidenced by the teachings of Niikawa. Niikawa teaches an image capturing device (such as a digital camera, see Fig. 9(a) - (21)) having *buttons* and a control wheel for manually selecting images to be transferred, wherein history information (see col. 15 line 36 - col. 19 line 40) for a particular image is stored (see col. 13 line 14 - col. 14 line 22) and the user can select to transfer images, including the option of all images and those already having been transferred not being transferred. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the use of Niikawa's manual-driven image transfer setup into Pavley's system as this would enhance Pavley's system to allow faster file transfers as images already transferred or archived would not be unnecessarily transferred again, thereby

Art Unit: 2157

reducing duplicate files and wasted time and confusion on behalf of the consumer. Also, Pavley teaches buttons such as programmable soft keys (416, see Fig. 2A), and in combination with Niikawa, would be obvious that the soft key buttons of Pavley represent the transfer image (see Niikawa Fig. 12, step D3) button Niikawa teaches.

Pavley and Niikawa (hereinafter "the combination") fail to teach a screen enabling a user to select between (1) transferring image data at the time of connection of said image transferring apparatus to another apparatus and (2) transferring image data in response to an instruction to transfer entered by the user with said image data transfer instruction unit, and judging accordingly. However, the use and advantages for using such a system is well known to one skilled in the art at the time the invention was made as evidenced by the teachings of Ward. Ward teaches a user displayable menu for a user to select various options as well as transmitting images when connected to a separate unit such as a camera dock (at least col. 1 line 51 – col. 2 line 11; col. 3, lines 19-39). Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made, to incorporate the use of Ward's system into the combination as this would enhance the combination to have a more automatic image transmission method and as Pavley teaches offering rule sets for the user to achieve goals for image files (see col. 5, lines 25-67), and as this eases the image transfer process as the combination teaches.

As per Claim 31, Pavley teaches the image transferring apparatus according to claim 30, wherein said display unit comprises a liquid crystal display screen (at least Fig. 1; LCD screen).

As per Claim 32, teaches the image transferring apparatus according to claim 30, wherein said image data transfer instruction unit is a button provided separately from said display unit (at least Niikawa Fig. 9(a) ref#21; Fig. 12; buttons and dials; and Pavley Fig. 2).

As per Claim 33, while Pavley fails to explicitly teach the image transferring apparatus according to claim 30, further comprising a notification unit, adapted to notify, after completion of image data transfer, of the completion, Pavley does teach rule sets occurring in the background as preferably setup by a user (at least col. 5 line 61 - col. 6 line 9), thus implying a user could set up rules so as to have interaction with the user and notify them of events such as an image being removed since it is already archived. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the use of user notifications as Pavley's system suggests this process could occur in the foreground.

As per Claim 34, Pavley teaches the image transferring apparatus according to claim 30, further comprising a message notification unit, adapted to attach a message notification to the image data to make reference to the transfer history information, and an instruction to delete image data that has not been previously transferred (archive file attribute indicating file deletion status) (at least col. 5 line 30 - col. 6 line 23).

As per Claim 35, Pavley teaches the image transferring apparatus according to claim 30, wherein said display unit identifiably displays reduced image data corresponding to the transferred image data based on the transfer history information (reduced resolution images, ie. scrennail, thumbnail; at least col. 4, lines 7-19, 44-56).

Art Unit: 2157

As per Claim 36, Pavley teaches an image transferring apparatus, comprising:  
a storage unit, adapted to store image data (memory) (at least col. 2, lines 34-46);

a transfer unit, adapted to transfer image data stored in said storage unit (at least col. 5, lines 45-60; col. 6, lines 10-24);

a changing unit, adapted to change transfer history information to a transferred status in the event that the transfer history information of the image data previously transferred by said transfer unit indicates that the image has not been transferred (auto image transfer according to archive attribute and marking image as archived) (at least col. 6, lines 3-24).

Pavley fails to *explicitly* teach said image data transfer instruction unit being a button for instructing the image data transfer. However, the use and advantages for using such image transfer control is well known to one skilled in the art at the time the invention was made as evidenced by the teachings of Niikawa. Niikawa teaches an image capturing device (such as a digital camera, see Fig. 9(a) - (21)) having buttons and a control wheel for manually selecting images to be transferred, wherein history information (see col. 15 line 36 - col. 19 line 40) for a particular image is stored (see col. 13 line 14 - col. 14 line 22) and the user can select to transfer images, including the option of all images and those already having been transferred not being transferred. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the use of Niikawa's manual-driven image transfer via a button into Pavley's system as this would enhance Pavley's system to allow a user

Art Unit: 2157

to select only images needing transfer, thus allowing faster file transfers as images already transferred or archived would not be unnecessarily transferred again, thereby reducing duplicate files and wasted time and confusion on behalf of the consumer.

Pavley and Niikawa (hereinafter "the combination") fail to teach a screen enabling a user to select between (1) transferring image data at the time of connection of said image transferring apparatus to another apparatus and (2) transferring image data in response to an instruction to transfer entered by the user with said image data transfer instruction unit. However, the use and advantages for using such a system is well known to one skilled in the art at the time the invention was made as evidenced by the teachings of Ward. Ward teaches a user displayable menu for a user to select various options as well as transmitting images when connected to a separate unit such as a camera dock (at least col. 1 line 51 – col. 2 line 11; col. 3, lines 19-39). Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made, to incorporate the use of Ward's system into the combination as this would enhance the combination to have a more automatic image transmission method and as Pavley teaches offering rule sets for the user to achieve goals for image files (see col. 5, lines 25-67), and as this eases the image transfer process as the combination teaches.

Claims 37-50 do not add or define any additional limitations over claims 30-36 and therefore are rejected for similar reasons.

As per Claim 51, Pavley teaches an image processing apparatus, comprising:  
a capturing unit adapted to capture a plurality of bodies of reduced image data, each corresponding to a respective image, from a storage medium of at least one

Art Unit: 2157

external device (reduced resolution images , ie. scrennail, thumbnail; at least col. 4, lines 7-19, 44-56);

a transfer unit, adapted to transfer image data stored in the storage medium (at least col. 5, lines 45-60; col. 6, lines 10-24);

a display control unit, adapted to perform control so as to display the reduced image data captured by said capturing unit (displaying thumbnails) (at least col. 4, lines 7-56); and

a screen display control unit, adapted to perform control so as to display a screen to enable a user to select between (1) selecting only image data stored in the storage medium which has not previously been transferred and (2) selecting all image data stored in the storage medium (selecting images from thumbnails in association with attributes such as archival attribute for synchronization) (at least col. 4, lines 7-56; col. 5, lines 30-49);

wherein the screen display control unit is adapted to control so as to display, selectively, in response to selection made by the user with said screen display control unit, either (1) only any image not previously transferred or (2) all images stored in the storage medium (auto image transfer according to archive attribute and marking image as archived) (at least col. 6, lines 3-24).

Pavley fails to explicitly teach offering the user control over transferring either (1) only any image not previously transferred or (2) all images stored in the storage medium. However, the use and advantages for using such image transfer control is well known to one skilled in the art at the time the invention was made as evidenced by the

Art Unit: 2157

teachings of Niikawa. Niikawa teaches an image capturing device (such as a digital camera, see Fig. 9(a) - (21)) having buttons and a control wheel for manually selecting images to be transferred, wherein history information (see col. 15 line 36 - col. 19 line 40) for a particular image is stored (see col. 13 line 14 - col. 14 line 22) and the user can select to transfer images, including the option of all images and those already having been transferred not being transferred. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the use of Niikawa's manual-driven image transfer setup into Pavley's system as this would enhance Pavley's system to allow faster file transfers as images already transferred or archived would not be unnecessarily transferred again, thereby reducing duplicate files and wasted time and confusion on behalf of the consumer.

Pavley and Niikawa (hereinafter "the combination") fail to teach a screen enabling a user to select between (1) transferring image data at the time of connection of said image transferring apparatus to another apparatus and (2) transferring image data in response to an instruction to transfer entered by the user with said image data transfer instruction unit, and judging accordingly. However, the use and advantages for using such a system is well known to one skilled in the art at the time the invention was made as evidenced by the teachings of Ward. Ward teaches a user displayable menu for a user to select various options as well as transmitting images when connected to a separate unit such as a camera dock (at least col. 1 line 51 – col. 2 line 11; col. 3, lines 19-39). Therefore, it would have been obvious to one of ordinary skill in the art, at the time the invention was made, to incorporate the use of Ward's system into the

Art Unit: 2157

combination as this would enhance the combination to have a more automatic image transmission method and as Pavley teaches offering rule sets for the user to achieve goals for image files (see col. 5, lines 25-67), and as this eases the image transfer process as the combination teaches.

As per Claim 52, Pavley teaches the image processing apparatus according to claim 51, wherein said capturing unit captures transfer history information on the image data (archive attribute) (at least col. 5, lines 30-45).

As per Claim 53, Pavley teaches the image processing apparatus according to claim 52, wherein said display control unit performs control so as to display identifiably the reduced image data corresponding to the transferred image data based on the transfer history information (reduced resolution images , ie. scrennail, thumbnail; at least col. 4, lines 7-19, 44-56).

As per Claim 54, Pavley teaches the image processing apparatus according to claim 51, wherein the screen displayed by said screen display control unit includes a screen which allows a user to select arbitrary image data (at least Fig. 1; col. 4, lines 7-47).

As per Claim 55, Pavley teaches the image processing apparatus according to claim 52, further comprising a message notification unit, adapted to notify the user by means of a warning message in the event that the transfer history information is referred to, and an instruction to delete the image data not previously transferred is made (archive file attribute indicating file deletion status) (at least col. 5 line 30 - col. 6 line 23).

As per Claim 56, Pavley teaches the image processing apparatus according to claim 52, wherein said display control unit changes an order of the reduced image data display based on the transfer history information (chronological display of thumbnail images) (at least col. 4, lines 7-47).

Claims 57-68 do not add or define any additional limitations over claims 51-56 and therefore are rejected for similar reasons.

### ***Response to Arguments***

4. Applicant's arguments with respect to claims 30-68 have been considered but are moot in view of the new ground(s) of rejection.

### ***Conclusion***

5. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

Art Unit: 2157

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Previously cited Morag et al, Miller et al, Otani et al, Dow, Peairs et al, Manolis et al, Anderson et al, Dwyer et al, Dow et al, Shiota et al, Loui et al, Kunishige and Fichtner are cited for disclosing pertinent information related to the claimed invention. Applicants are requested to consider the prior art reference for relevant teachings when responding to this office action.

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Gregory G. Todd whose telephone number is (571)272-4011. The examiner can normally be reached on Monday - Friday 9:00am-6:00pm w/ first Fridays off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ario Etienne can be reached on (571)272-4001. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Art Unit: 2157

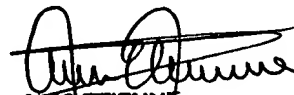

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
